INHIBITORS OF  $\alpha_4\beta_1$  MEDIATED CELL ADHESIONBACKGROUND OF THE INVENTIONField of the Invention

The present invention relates to small molecules  
5 that are potent inhibitors of  $\alpha_4\beta_1$  mediated adhesion to  
either VCAM or CS-1 and which could be useful for the  
treatment of inflammatory diseases.

Description of Related Art

The extracellular matrix (ECM) is the major  
10 component of connective tissue which provides structural  
integrity, and promotes cell migration and  
differentiation. As part of these functions,  
extracellular matrix molecules such as fibronectin,  
collagen, laminin, von Willebrand factor,  
15 thrombospondin, fibrinogen, and tenascin have been shown  
to support adhesion of cells *in vitro*. This adhesive  
interaction is critical for a number of biological  
processes including hemostasis, thrombosis, wound  
healing, tumor metastasis, immunity and inflammation.

20 Fibronectin (FN) is the prototype ECM molecule.  
The major cell attachment site in the fibronectin  
molecule has been reproduced synthetically with the  
amino acid sequence arginine-glycine-aspartic acid, or  
RGD using single letter nomenclature. Peptides  
25 containing the RGD sequence which either inhibit or  
promote cell adhesion have been described (US Patent  
Nos. 4,589,881; 4,661,111; 4,517,686; 4,683,291;

4,578,079; 4,614,517; and 4,792,525). Changes in the peptide as small as the exchange of alanine for glycine or glutamic acid for aspartic acid, which constitute the addition of a single methyl or methylene group to the tripeptide, eliminates these activities (Pierschbacher et al., *Proc. Natl. Acad. Sci. USA* 81:5985 (1984)). Recently, a second FN cell binding domain has been identified within the alternatively spliced region of the A chain of the molecule, known as the connecting segment 1 (CS-1). The most active cell-binding site within this alternatively spliced region is composed of 25 amino acids where the carboxy terminus contains the sequence EILDVPST. The amino acid sequence EILDVPST forms a recognition motif on FN for cell surface receptors. (Wayner et al., *J. Cell Biol.* 109:1321 (1989); Guan et al., *Cell* 60:53 (1990)).

The receptors which recognize these sites on FN belong to a gene superfamily called integrins which consist of heterodimeric complexes of non-covalently associated alpha and beta subunits. A common  $\beta$  subunit combines with unique  $\alpha$  subunits to form an adhesion receptor of defined specificity. To date, 8  $\beta$  subunits have been identified which can dimerize with 16 distinct  $\alpha$  subunits forming 22 distinct integrins. The  $\beta 1$  subfamily, also known as the VLA family (Very Late Activation Antigens), binds to ECM molecules such as FN, collagen and laminin. For reviews, see, Hynes, *Cell* 48:549 (1987); Hemler, *Annu. Rev. Immunol.* 8:365 (1990). Leukocyte interaction with FN at the two spatially separate binding domains is mediated by two distinct integrins. The RGD site is recognized by the integrin  $\alpha_5\beta_1$ , while, EILDV is recognized by  $\alpha_4\beta_1$  (Pytela et al., *Cell* 40:191 (1985); Wayner et al., *J. Cell Biol.* 109:1321 (1989); Guan et al., *Cell* 60:53 (1990)).

Vascular endothelial cells form the interface between blood and tissues and control the passage of leukocytes as well as plasma fluid into tissues. A

variety of signals generated at the site of inflammation can activate both endothelial cells as well as circulating leukocytes so that they become more adhesive to one another. Following this initial adhesion the leukocytes migrate into the tissues to perform host defense functions. Several adhesion molecules have been identified which are involved in leukocyte-endothelial interactions.

In the  $\beta_1$  subfamily, in addition to binding to fibronectin,  $\alpha_4\beta_1$  interacts with a cytokine inducible protein on endothelial cells termed vascular cell adhesion molecule (VCAM). Further involved in the leukocyte-endothelial adhesion process is the  $\beta_2$  integrin subfamily.  $\beta_2$  integrins include CD11a/CD18, CD11b/CD18, and CD11c/CD18. In addition, the  $\beta_7$  subunit associates with  $\alpha_4$  to form a unique  $\alpha_4\beta_7$  heterodimer which binds to FN, to VCAM, and to Mucosal Addressin Cell Adhesion Molecule-1 (MAdCAM) (Ruegg et al, *J. Cell.Biol.* 117:179 (1992); Andrew et al., *J. Immunol.* 153:3847 (1994); Briskin et al., *Nature* 363:461 (1993); Shyjan et al, *J. Immunol.* 156:2851 (1996)).  $\alpha_4$  integrins are widely expressed on different cell types including hematopoietic progenitors, lymphocytes, natural killer cells, monocytes, eosinophils, basophils, and mast cells (Helmer, M. E., *Annu. Rev. Immunol.* 8:365 (1990)). Other molecules on endothelial cells which bind to the leukocytes include ICAM-1, ICAM-2, E-selectin and P-selectin (Carlos and Harlan, *Immunol. Rev.* 114:1 (1990); Osborn, L., *Cell* 62:3 (1990); Springer T., *Nature* 346:425 (1990); Geng et al., *Nature* 347:757 (1990); Stoolman, *Cell* 56:907 (1989)).

A number of in vitro and in vivo studies indicate that  $\alpha_4\beta_1$  plays a critical role in the pathogenesis of a variety of diseases. Monoclonal antibodies directed against  $\alpha_4$  have been tested in a variety of disease models. Anti- $\alpha_4$  antibodies block adhesion of lymphocytes to synovial endothelial cells; this adhesion plays a

potential role in rheumatoid arthritis (van Dinther-Janssen et al, *J. Immunol.* 147:4207 (1991)).  $\alpha_4$  has also been implicated with respect to rheumatoid arthritis in separate studies (Laffon et al, *J. Clin. Invest.* 88:546  
5 (1991); Morales-Ducret et al, *J. Immunol.* 149:1424 (1992)). A significant number of studies have evaluated the role of  $\alpha_4$  in allergy and asthma. For example, monoclonal antibodies to  $\alpha_4$  block adhesion of basophils and eosinophils to cytokine activated endothelial cells  
10 (Walsh et al, *J. Immunol.* 146:3419 (1991); Bochner et al, *J. Exp. Med.* 173:1553 (1991)). Monoclonal antibodies to  $\alpha_4$  were also effective in several lung antigen challenge models (Abraham et al, *J. Clin. Invest.* 93:776 (1994); Weg et al, *J. Exp. Med.* 177:561  
15 (1993)). The cotton-top tamarin, which experiences spontaneous chronic colitis, showed a significant attenuation of their colitis when anti- $\alpha_4$  antibody was administered (Podolsky et al, *J. Clin. Invest.* 92:372 (1993); Bell et al, *J. Immunol.* 151:4790 (1993)). In a  
20 rat and mouse model, autoimmune encephalomyelitis was blocked by anti- $\alpha_4$  antibody (Yednock et al, *Nature* 356:63 (1992); Baron et al, *J. Exp. Med.* 177:57 (1993)). Anti- $\alpha_4$  monoclonal antibodies also inhibit insulinitis and delay the onset of diabetes in the non-obese diabetic  
25 mouse (Baron et al, *J. Clin. Invest.* 93:1700 (1994); Yang et al, *Proc. Natl. Acad. Sci. USA* 90:10494 (1993); Burkly et al, *Diabetes* 43:529 (1994)).  $\alpha_4$  is also implicated in atherosclerosis due to its endothelial expression during atherogenesis (Cybulsky et al, *Science*  
30 251:788 (1991)). The migration of leukocytes to an inflammatory site can also be blocked by anti- $\alpha_4$  antibodies. In addition to the blocking of migration, inhibitors of leukocyte endothelial adhesion may block the costimulatory signals mediated by integrins and thus  
35 inhibit overproduction of inflammatory cytokines. In a separate set of experiments not using anti- $\alpha_4$  antibodies, the peptides GRDGSP or EILDV were tested against contact

hypersensitivity response. The contact hypersensitivity response was found to be blocked by GRDGSP or EILDV suggesting that both  $\alpha_4\beta_1$  and  $\alpha_5\beta_1$  are involved in this inflammatory response.

5 Other ailments which may involve  $\alpha_4\beta_1$ -mediated conditions include the inflammatory disorders rheumatoid arthritis, allergic disorders, asthma, spontaneous chronic colitis, insulinitis, contact hypersensitivity response, atherosclerosis and autoimmune  
10 encephalomyelitis. These studies illustrate that small molecules that are potent inhibitors of  $\alpha_4\beta_1$  mediated adhesion to either VCAM-1 or CS-1 may be used as a form of treatment in numerous inflammatory diseases. However, these inflammatory conditions could be expanded  
15 to include adult respiratory distress syndrome, AIDS, cardiovascular diseases, thrombosis or harmful platelet aggregation, reocclusion following thrombolysis, allograft rejection, reperfusion injury, psoriasis, eczema, contact dermatitis and other skin inflammatory  
20 diseases, osteoporosis, osteoarthritis, atherosclerosis, neoplastic diseases including metastasis of neoplastic or cancerous growth, wound healing enhancement, treatment of certain eye diseases such as detaching retina, Type I diabetes, multiple sclerosis, systemic  
25 lupus erythematosus (SLE), inflammatory and immunoinflammatory conditions including ophthalmic inflammatory conditions and inflammatory bowel diseases, ulcerative colitis, regional enteritis and other autoimmune diseases. Accordingly, a compound which  
30 could inhibit these conditions is desirable.

35 aggregation, reocclusion following thrombolysis, allograft rejection, reperfusion injury, psoriasis, eczema, contact dermatitis and other skin inflammatory

diseases, osteoporosis, osteoarthritis, atherosclerosis, neoplastic diseases including metastasis of neoplastic or cancerous growth, wound healing enhancement, treatment of certain eye diseases such as detaching

The dose of the desired compound of the present invention or a pharmaceutically acceptable salt thereof varies depending on an administration method, age, body  
20 weight, and state of a patient, but, in general, the daily dose is preferably about 0.1 to 100 mg/kg/day, particularly preferably 1 to 100 mg/kg/day.

Preferred routes of administration for asthma:

It is preferred that the compound of the present  
25 invention be administered in the form of an Aerosol. However, other routes of administration include intravenous, oral, intramuscular, and subcutaneous.

In the case of aerosol administration, compositions containing the compounds of the present invention can be  
30 prepared to provide for an excellent means for administering in aerosol form for inhalation therapy. Accordingly, the present invention will provide for self-propelling compositions containing the compounds of the present invention.

Propellants employed should be non-toxic and have a vapor pressure suitable for the conditions under which administration occurs. These propellants can be fluorinated or fluorochlorinated lower saturated aliphatic hydrocarbons. The preferred propellants of this type are the halogenated alkanes containing not more than two carbon atoms and at least one fluorine atom. Illustrative of these are trichloromonofluoromethane, dichlorodifluoromethane, monochlorotrifluoromethane, dichloromonofluoromethane and 1,2-dichloro-1,1,2,2-tetrafluoroethane. These compounds are available from E.I. duPont de Nemours and Company under the trade name "Freon". These propellants may be employed singularly or in admixture.

In addition to the propellant, an organic solvent may also be employed. The organic solvent must be non-toxic and without undesirable effects on inhalation in the amount present in the aerosol produced. In addition, the solvent should be substantially anhydrous, completely miscible with the propellant or mixture of propellants employed and have a suitable boiling point. Examples of such solvents included non-toxic aliphatic alcohols such as ethanol; ethers such as ethyl ether and vinyl ether; ketones such as acetone; and suitable halogenated lower alkanes.

In addition to the organic solvent, the composition may also optionally contain a non-toxic hygroscopic glycol. The glycol must be substantially miscible with the organic solvent and the propellant employed. Satisfactory glycols include propylene glycol, triethylene glycol, glycerol, butylene glycol and hexylene glycol.

The above indicated methods of administration and formulation of aerosol compositions should not be viewed as limiting. The compounds of the present invention can be formulated in anyway deemed suitable to one of

ordinary skill in the art so as to obtain the desired effects.

#### Pharmaceutical Compositions

As indicated previously, the compounds of formula (I) can be formulated into pharmaceutical compositions. In determining when a compound of formula (I) is indicated for the treatment of a given disease, the particular disease in question, its severity, as well as the age, sex, weight, and condition of the subject to be treated, must be taken into consideration and this perusal is to be determined by the skill of the attendant physician.

For medical use, the amount of a compound of Formula (I) required to achieve a therapeutic effect will, of course, vary both with the particular compound, the route of administration, the patient under treatment, and the particular disorder or disease being treated. A suitable daily dose of a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for a mammalian subject suffering from, or likely to suffer from, any condition as described hereinbefore is 0.1 mg to 100 mg of the compound of formula I, per kilogram body weight of the mammalian subject. In the case of systematic administration, the dose may be in the range of 0.5 to 500 mg of the compound per kilogram body weight, the most preferred dosage being 0.5 to 50 mg/kg of mammal body weight administered two to three times daily. In the case of topical administration, e.g., to the skin or eye, a suitable dose may be in the range of 0.1  $\mu$ g to 100  $\mu$ g of the compound per kilogram, typically about 0.1  $\mu$ g/kg.

In the case of oral dosing, a suitable dose of a compound of Formula (I), or a physiologically acceptable salt thereof, may be as specified in the preceding paragraph, but most preferably is from 1 mg to 10 mg of the compound per kilogram, the most preferred dosage

being from 1 mg to 5 mg/kg of mammal body weight, for example, from 1 to 2 mg/kg. Most preferably, a unit dosage of an orally administrable composition encompassed by the present invention contains less than  
5 about 1.0 g of a formula (I) compound.

It is understood that formulation, both for human and veterinary use, of the present invention may be presented to the mammal by inhalation. To achieve therapeutic effect, the dose may be in the range of 0.5  
10 to 500 mg of the compound, per kg body weight. The most preferred dosage being 0.5 to 50 mg/kg of mammal body weight administered two to three times daily.

It is understood that the ordinarily skilled physician or veterinarian will readily determine and  
15 prescribe the effective amount of a compound of Formula I to prevent or arrest the progress of the condition for which treatment is administered. In so proceeding, the physician or veterinarian could employ relatively low doses at first, subsequently increasing the dose until  
20 a maximum response is obtained.

The compounds and compositions of the present invention can be administered to patients suffering from a condition listed herein in an amount which is effective to fully or partially alleviate undesired  
25 symptoms of the condition. The symptoms may be caused by inappropriate cell adhesion mediated by  $\alpha_4\beta_1$  integrins. Such inappropriate cell adhesion would typically be expected to occur as a result of increased VCAM-1 and/or CS-1 expression on the surface of  
30 endothelial cells. Increased VCAM-1 and/or CS-1 expression can be due to a normal inflammation response or due to abnormal inflammatory states. In either case, an effective dose of a compound of the invention may reduce the increased cell adhesion due to increased  
35 VCAM-1 expression by endothelial cells. Reducing the adhesion observed in the disease state by 50% can be considered an effective reduction in adhesion. More

preferably, a reduction in adhesion by 90%, is achieved. Most preferably adhesion mediated by VCAM-1/ $\alpha_4\beta_1$  and/or CS-1 interaction is abolished by an effective dose. Clinically, in some instances, effect of the compound  
5 can be observed or a decrease in white cell infiltration into tissues or a site of injury. To achieve a therapeutic effect, then, the compounds or compositions of the present invention are administered to provide a dose effective to reduce or eliminate inappropriate cell  
10 adhesion or to alleviate undesired symptoms.

While it is possible for an active ingredient to be administered alone, it is preferable to present it as a pharmaceutical formulation comprising a compound of Formula (I) and a pharmaceutically acceptable carrier  
15 thereof. Such formulations constitute a further feature of the present invention.

The formulations, both for human and veterinary medical use, of the present invention comprise an active ingredient of Formula (I), in association with a  
20 pharmaceutically acceptable carrier thereof and optionally other therapeutic ingredient(s), which are generally known to be effective in treating the disease or condition encountered. The carrier(s) must be "acceptable" in the sense of being compatible with the  
25 other ingredients of the formulations and not deleterious to the recipient thereof.

The formulations include those in a form suitable for oral, pulmonary, ophthalmic, rectal, parenteral (including subcutaneous, intramuscular, and  
30 intravenous), intra-articular, topical, nasal inhalation (e.g., with an aerosol) or buccal administration. Such formulation are understood to include long-acting formulations known in the art.

The formulations may conveniently be presented in  
35 unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods may include the step of bringing the active ingredient

into association with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired form.

Formulations of the present invention suitable for oral administration may be in the form of discrete units such as capsules, cachets, tablets, or lozenges, each containing a predetermined amount of the active ingredient in the form of a powder or granules; in the form of a solution or suspension in an aqueous liquid. Formulations for other uses could involve a nonaqueous liquid; in the form of an oil-in-water emulsion or a water-in-oil emulsion; in the form of an aerosol; or in the form of a cream or ointment or impregnated into a transdermal patch for use in administering the active ingredient transdermally, to a patient in need thereof. The active ingredient of the present inventive compositions may also be administered to a patient in need thereof in the form of a bolus, electuary, or paste.

7-A (1.15 g, 3.96 mmol) was dissolved in dry THF (5 mL). The reaction flask was immersed in a -15 °C bath  
10 (ethylene glycol/CO<sub>2</sub>), then diborane-tetrahydrofuran (1M, 1 equiv, 3.96 mmol, 3.96 mL) was added slowly. The reaction solution was stirred at -15 °C under N<sub>2</sub> during the day, and was equilibrated to room temperature overnight. The reaction solution was  
15 treated with potassium carbonate (1.2 g) in H<sub>2</sub>O (25 mL). The THF layer was separated and the aqueous phase was extracted with EtOAc (3 x 20 mL). The organic layers were combined, washed with saturated NaCl (20 mL) and dried (MgSO<sub>4</sub>). Solvent was removed in  
20 vacuo from the mixture to yield 0.83 g (76%) of 9-B. The crude product was chromatographed, initially using CH<sub>2</sub>Cl<sub>2</sub>, as eluent followed by CH<sub>2</sub>Cl<sub>2</sub>/MeOH (5%). Recovered desired product 9-B (0.76 g, 69%) from column: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 0.80 (3 H), 1.00 (3 H), 1.11 (3 H), 1.32-1.47 (1 H), 1.62-1.91 (2 H), 2.09-2.22 (1H), 2.86 (1 H), 3.48-3.59 (2 H), 5.08-5.18 (2 H), 7.28-7.41 (5 H).

A solution of benzyl ester 9-B (0.76 g, 2.75 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (10 mL) was treated at 0 °C and under N<sub>2</sub> with  
30 ethyl diazoacetate (5 equiv, 13.75 mmol, 1.4 mL) and a catalytic amount of HBF<sub>4</sub> (0.1 equiv, 0.03 mL). The reaction solution was stirred under N<sub>2</sub> overnight while the bath temperature equilibrated to room temperature. Solvent was removed under reduced  
35 pressure to yield 1.8 g of product. Crude product was

subjected to silica gel (35 mm x 15.2 cm) flash column chromatography, eluting with 2%-10% EtOAc/hexanes, to provide 0.64 g (64%) of 9-C: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 0.81 (3H), 1.05 (3 H), 1.12 (3 H), 1.22-1.31 (3 H), 1.32-1.43 (1 H), 1.54-1.62 (2 H), 1.65-1.92 (2 H), 2.08-2.23 (1 H), 2.85 (1 H), 3.28 (1 H), 3.47 (1 H), 3.96-4.08 (2H), 4.14-4.25 (2 H), 5.07-5.18 (2H), 7.28-7.40 (5 H).

Benzyl ester 9-C (0.3 g, 0.83 mmol) was dissolved in absolute EtOH (10 mL). The solution was treated with a catalytic amount of 10% Pd/C (0.2 g) and hydrogenated at 20 psi for 1 h on a Parr hydrogenation apparatus. The suspension was filtered through a Celite cake and washed cake with EtOH. Solvent was removed from the filtrate under reduced pressure to yield 0.19 g (84%) of 9-D: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 0.90 (3 H), 1.06 (3 H), 1.16 (3 H), 1.19-1.32 (3 H), 1.33-1.45 (1H), 1.65-1.92 (2 H), 2.03-2.18 (1 H) 2.83 (1 H), 3.29 (1 H), 3.49 (1 H), 3.95-4.11 (2H), 4.19 (2 H).

10 carboxylic acid methyl ester (**10-A**) (5.0 g, 23 mmol, 1

flask was immersed in a -15°C bath (ethylene  
glycol/dry ice) and then boron  
trifluoride-tetrahydrofuran (1 equiv, 1 M, 23 mmol, 23  
15 mL) was slowly added. [Note: observed mild evolution  
of H<sub>2</sub> gas]. The reaction solution was allowed to stir  
for 24 hrs under N<sub>2</sub>. The solution was stirred in the  
-15°C bath during the day, and the bath was permitted  
to reach room temperature overnight. Silica gel  
20 Thin-layer chromatography, using 1:1 hexanes/ethyl

was consumed. Consequently, the reaction solution was  
quenched with H<sub>2</sub>O (100 mL) and then treated with  
potassium carbonate (6 g). The THF phase was separated

saturated NaCl (100 mL) and dried (MgSO<sub>4</sub>). The solvent  
was removed via rotary evaporator and then by  
overnight hi vacuum conditions to yield 4.7 g of crude

(1*S*-*cis*)-[3-hydroxymethyl-2,2,3-trimethyl]-cyclopentane carboxylic acid methyl ester **10B** (1.5 g, 7.5 mmol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (35 mL). 25 To 10-A (25g, 0.117mol) in a 500mL Parr bottle, cooled in a dry ice-iPrOH bath under nitrogen, was condensed isobutylene until the bottle was approximately 1/2 full. A solution of (1R)-camphoric anhydride, prepared by the method of Bell, K.H. *Aust. J. Chem.* 1981, 34, 665-670, (5g, 27.44 mmol) in toluene (400 mL) in a round bottom flask is flushed with N<sub>2</sub> and then cooled in a dry ice/ ethanol bath. 1N NaOH (7.3 ml) was added dropwise to a mixture of (1*S*-*cis*)-*N*-[(3-Carboxy-2,2,3-trimethylcyclopentyl)carbonyl]-1-[(3,4-dichlorophenyl)methyl]-*L*-histidine methyl ester (C<sub>24</sub>H<sub>29</sub>Cl<sub>2</sub>N<sub>3</sub>O<sub>5</sub>) (1.50 g) in MeOH (20 ml) at 0°C. The mixture was stirred at room temperature for 15 hr, concentrated in vacuo, diluted with H<sub>2</sub>O, and acidified with 1N HCl to pH 5-6. The resulting precipitate was collected by filtration, washed with H<sub>2</sub>O, dried, and recrystallized from DMF/H<sub>2</sub>O to give (1*S*-*cis*)-*N*-[(3-Carboxy-2,2,3-trimethylcyclopentyl)carbonyl]-1-[(3,4-dichlorophenyl)methyl]-*L*-histidine (0.87 g), mp 148-149°C (dec), MS (m/z):496 (MH<sup>+</sup>).

Benzyl (S)-2-amino-3-(2-naphthyl) propionate tosylate (0.20 g) was partitioned between AcOH and sat. NaHCO<sub>3</sub>. The organic layer was washed with H<sub>2</sub>O, brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and the solvent was removed in vacuo. The resulting mixture was extracted with AcOH. The extract was washed with H<sub>2</sub>O, brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and the solvent was removed in vacuo. The residue was purified by column chromatography on silica gel

(eluent; 9:1, CHCl<sub>3</sub>/AcOEt) to give [1S-[1 $\alpha$ (R\*),3 $\alpha$ ]]- $\alpha$ -

 trimethylcyclopentyl)carbonyl]amino]-2-  
 naphthalenepropanoic acid (C<sub>23</sub>H<sub>27</sub>NO<sub>5</sub>).

10% Pd-C (0.05 g) was added to a solution of

 naphthalenepropanoic acid phenylmethyl ester (C<sub>30</sub>H<sub>33</sub>NO<sub>5</sub>)  
 (0.20g) in MeOH (10ml) and the mixture was subjected  
 to hydrogenolysis at a hydrogen pressure of 50 psi.

HCl gas was bubbled through a solution of N-(tert-butoxycarbonyl)-4-(2,6-dichlorobenzamido)-L-phenylalanine (800 mg) in MeOH (15 ml) for 5 minutes

and the mixture was stirred for 3 hr. at room temperature. Excess HCl was removed by bubbling N<sub>2</sub> through the mixture and the solvent was removed in vacuo. The residue was washed with ether and dried.

- 5 To the resulting solid was added THF (10 ml) containing DIEA (1.3 ml), BOP Reagent (938 mg) and (1S,3R)-3-(tert-butoxycarbonyl)-2,2,3-trimethylcyclopentanecarboxylic acid (480 mg), which was prepared by the saponification of methyl (1S,3R)-  
10 3-(tert-butoxycarbonyl)-2,2,3-trimethylcyclopentanecarboxylate derived from methyl (1S,3R)-3-carboxy (or chlorocarbonyl)-2,2,3-trimethylcyclopentanecarboxylate and t-BuOH. The mixture was stirred overnight under N<sub>2</sub> and the solvent  
15 was removed in vacuo.

- 1N HCl (10 ml) was added to the residue and the mixture was extracted with AcOEt. The extract was washed with 1N HCl, brine, sat. NaHCO<sub>3</sub>, brine, sat. LiCl, and brine, dried over MgSO<sub>4</sub>, and evaporated in  
20 vacuo.

- The residue was purified by column chromatography on silica gel (eluent; 3:2, Hexane/AcOEt) to give (1S-cis)-N-[[3-[(1,1-Dimethylethoxy)carbonyl]-2,2,3-trimethylcyclopentyl]carbonyl]-4-[(2,6-dichlorobenzoyl)amino]-L-phenylalanine methyl ester

R. Example 58.

The aminoester product of Reference Example 58 is useful as a synthetic intermediate (for example, reagent 37-B of Scheme 37). Reference Example 58 is prepared as follows:

To a cold (0-5°C) solution of anhydrous methanolic HCl was added 100 g of L-4-nitrophenylalanine (Advanced ChemTech) portionwise over 15 min. The mechanically stirred mixture was heated to gentle reflux for 48 h. The mixture was allowed to cool and then filtered through a sintered glass filter funnel, washing the collected solids with hot MeOH until only insoluble residues remained. The filtrate was concentrated *in vacuo* to afford the methyl ester (120 g) as waxy off white solid which was used without further purification.

To a suspension of methyl ester described above (87 g, 0.33 mole) in CH<sub>2</sub>Cl<sub>2</sub> (1500 mL) at ambient temperature was added di-*t*-butyldicarbonate (109 g, 0.50 mole) followed by the dropwise addition of Et<sub>3</sub>N (51 mL, 0.37 mole). After 15 min additional Et<sub>3</sub>N (40 mL, 0.29 mol) was added to maintain a slightly basic mixture (ca. pH 8). The reaction mixture was stirred 18 h and additional CH<sub>2</sub>Cl<sub>2</sub> (1400 mL) and Et<sub>3</sub>N (15 mL, 0.11 mol) were added. After an additional 2 h the reaction mixture was quenched by the slow addition of MeOH (100 mL), stirred for 1 h and then partitioned between CH<sub>2</sub>Cl<sub>2</sub> and cold 10% aqueous KHSO<sub>4</sub>. The organic layer was washed with saturated NaHCO<sub>3</sub> and brine, dried

( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated in vacuo. Flash chromatography of the residue using hexane and a gradient of a 1:1 mixture of  $\text{EtOAc}/\text{CH}_2\text{Cl}_2$  (25-33%) afforded the Boc-methyl ester (69 g) as a white solid. Physical properties as follows:  $^1\text{H}$  NMR (300 MHz;  $\text{CDCl}_3$ )  $\delta$  8.16 (2H), 7.31 (2H), 5.04 (1H), 4.63 (1H), 3.73 (3H), 3.18 (2H), 1.41 (9H); MS (ES+) for  $\text{C}_{15}\text{H}_{20}\text{N}_2\text{O}_6$   $m/z$  325.2 ( $\text{M}+\text{H}$ ) $^+$ .

Palladium on carbon (10% w/w, 1.25 g) was added to a Parr hydrogenation flask under a  $\text{N}_2$  atmosphere and carefully wetted with 100 mL of  $\text{MeOH}/\text{THF}$  (1:1). A solution of the Boc-methyl ester described above (25 g, 77 mmol) in 400 mL of  $\text{MeOH}/\text{THF}$  (1:1) was added and the mixture shaken on a hydrogenation apparatus under a hydrogen atmosphere (20 psi) for 1 h at ambient temperature. The reaction mixture was filtered through a pad of Celite and the solids washed several times with  $\text{MeOH}$ . The combined filtrates were concentrated in vacuo to afford the 4-aminophenylalanyl derivative (22.7 g) which was used without further purification. Physical properties as follows:  $^1\text{H}$  NMR (300 MHz,  $\text{CDCl}_3$ )  $\delta$  6.89 (2H), 6.61 (2H), 4.96 (1H), 4.50 (1H), 3.69 (3H), 2.95 (2H), 1.41 (9H); MS (ES+) for  $\text{C}_{15}\text{H}_{22}\text{N}_2\text{O}_4$   $m/z$  295.2 ( $\text{M}+\text{H}$ ) $^+$ .

A cold (0-5°C) solution of 2,6-dichlorobenzoyl chloride (11.1 mL, 77.5 mmol) in 125 mL of THF was treated dropwise with a solution of the 4-aminophenylalanyl derivative described above (22.7 g, 77.1 mmol) and  $\text{Et}_3\text{N}$  (16 mL, 115 mmol) in 125 mL of THF. The reaction mixture was allowed to warm to temperature and stir an additional 18 h. The mixture was diluted with  $\text{EtOAc}$  (2 L) and then washed with 1N  $\text{HCl}$ ,  $\text{H}_2\text{O}$ , 1N  $\text{NaOH}$  and brine. The organic extract was dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated in vacuo to give the crude product as a pale yellow solid. This material was recrystallized from acetone/hexanes (ca. 1:1) to afford the amide (30.8 g) as a crystalline solid. Physical properties as follows: mp 192.2-

193.1°C; IR (mull) 3305, 1747, 1736, 1690, 1665, 1609, 1548, 1512, 1433, 1414, 1325, 1277, 1219, 1171, 781  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR (300 MHz;  $\text{CDCl}_3$ )  $\delta$  7.57 (2H), 7.34 (4H), 7.14 (2H), 4.98 (1H), 4.60 (1H), 3.74 (3H), 3.11 (2H), 1.42 (9H); MS (ES+) for  $\text{C}_{22}\text{H}_{24}\text{Cl}_2\text{N}_2\text{O}_5$   $m/z$  467.0 (M+H) $^+$ .

To 650 mL of anhydrous 4M HCl in dioxane at ambient temperature was added the amide described above (30.6 g, 65.5 mmol) portionwise and the resulting mixture was stirred until all the solids had dissolved (ca. 1 h). Volatiles were removed in vacuo to give a light yellow solid which was partitioned between water (500 mL) and ether (1 L). The water layer was separated and concentrated in vacuo to approximately 200 mL. The aqueous solution was then frozen and lyophilized to afford the aminoester product Reference Example 58 (25.6 g) as a light yellow solid. ## 25 Biological Assays

### Jurkat-Endothelial Cell Adhesion Assay:

The following assay established the activity of the present compounds in inhibiting  $\beta_1$ -mediated cell adhesion in a representative in vitro system. This assay measures the adhesive interactions of a T-cell line, Jurkat, known to express the  $\alpha_4\beta_1$  integrin, to endothelial monolayers in the presence of test compounds. The test compounds were added in increasing concentrations to T-cells and then the T-cell compound mixture was added to IL-1 stimulated endothelial cell monolayers. The plates were incubated, washed and the percentage of attached cells

was quantitated. The present assay directly demonstrates the cell adhesion inhibitory activity and adhesion modulatory activity of the compounds. Human umbilical vein endothelial cells were purchased from Clonetics (San Diego, CA.) at passage number 2. The cells were grown on 0.5% porcine skin gelatin pre-coated flasks (Sigma, St. Louis MO.) in EGM-UV media (Clonetics, San Diego, CA) supplemented with 10% fetal bovine serum. Cells are refed every 2-3 days reaching confluence by day 4 to 6. The cells are monitored for factor VIII antigen and results show that at passage 12, the cells are positive for this antigen. The endothelial cells are not used following passage 6. The T-cell line Jurkat was obtained from American Type Tissue Culture Collection (Rockville, MD) and the cells were cultured in RPMI containing 10 % fetal calf serum. The cells were washed twice in Hank's Balanced Salt Solution (HBSS) and resuspended in Dulbecco's Minimal Eagle's Media (DMEM) containing 2.5 mg/ml Human Serum Albumin (HSA). Jurkat cells ( $1 \times 10^6$  cells/ml) were stained with 10 ng/ml BCECF-AM (Molecular Probes, Eugene, OR) in HBSS without phenol red. The cells were loaded with BCECF for 60 minutes in the dark at 37°C, washed 2 times, and resuspended in DMEM-HSA solution. Confluent endothelial monolayers, grown in 96-well tissue culture plates, were stimulated for 4 hr. at 37 °C with 0.1 ng/ml (~50 U/ml) recombinant IL-1 (Amgen, Thousand Oaks, CA). Following this incubation, the monolayers were washed twice with HBSS and 0.1 ml of DMEM-HSA solution was added. Jurkat cells ( $5 \times 10^5$  cells) were combined with the appropriate concentration of the test compound and 0.1 ml of the Jurkat cell-compound mixture was added to the endothelial cell monolayers. Generally, 100, 20, 5 and 1.25  $\mu$ M compound concentrations were tested. These concentrations are adjusted downward for analogs found or thought to be more potent. The plates were placed on ice for 5 minutes to allow for Jurkat cell

settling and the plates were incubated at 37 °C for 20 minutes. Following this incubation, the monolayers were washed twice with PBS containing 1 mM calcium chloride and 1 mM magnesium chloride and the plates were read using a Millipore Cytofluor 2300 (Marlboro, MA.). Fluorescence in each well was measured as Arbitrary Fluorescence Units and percent adhesion in the absence of compound was adjusted to 100% and the % adhesion in the presence of compound was calculated. Monolayers were also fixed in 3% paraformaldehyde and evaluated microscopically to verify the adhesion. This procedure is a modification of a previously published method (Cardarelli et al., *J. Biol. Chem.* 269:18668-18673 (1994)).

Jurkat-CS-1 assay

The CS-1 derived peptide, CLHPGEILDVPST, and the scrambled control peptide, CLHGPIELVSDPT, were synthesized on a Beckman 990 synthesizer using t-Boc methodology. The peptides were immobilized onto microtiter plates using the heterobifunctional crosslinker 3-(2-pyridyldithio)propionic acid N-hydroxysuccinimide ester (SPDP) as reported by Pierschbacher et al., *Proc. Natl. Acad. USA*, 80:1224-1227 (1983). Microtiter plates were coated with 20 µg/ml HSA for 2 hr. at room temperature, washed once with PBS and derivatized with 10 µg/ml SPDP for 1 hr. After washing, 100 µl of a 100 µg/ml cysteine containing peptide solution which had been recently dissolved was added to the wells and allowed to crosslink to the plates overnight at 4 °C. Unbound peptide was removed from plates by washing with PBS. To block non-reacted sites, the plates are coated with 100 µl of a 2.5 mg/ml BSA solution in PBS for 1 hr. at 37 °C. 100 µl of Jurkat cells (2.5 x 10<sup>6</sup> cells/ml) in DMEM plus BSA (2.5 mg/ml) was mixed with an appropriate concentration of the compound to be tested and the mixture was added to peptide coated dishes and incubated for 1 hr. at 37 °C. Generally 100, 20, 5 and

1.25  $\mu\text{M}$  concentrations of the compound were tested. The concentrations of the compound were adjusted downward for compounds thought or found to be more potent.

5        Following this incubation the plates were washed once with PBS and the attached cells were fixed with 3% paraformaldehyde in PBS and stained with 0.5% toluidine blue in 3.7% formaldehyde. The cells were stained overnight at room temperature and the optical  
10       density at 590 nm of toluidine blue stained cells was determined using a vertical pathway spectrophotometer to quantitate attachment (VMAX Kinetic Microplate Reader, Molecular Devices, Menlo Park, CA). This procedure is a modification of a previously published  
15       method (Cardarelli et al, J. Biol. Chem., 269:18668-18673 (1994) and Cardarelli et al, Proc. Natl. Acad. Sci. USA, 83:2647-2651 (1986)).

      The preferred compounds are those which have low  $\text{IC}_{50}$  values in the Jurkat EC assay or the Jurkat-CS-1  
20       assay described above or which have at least moderate activity in both assays. All of the compounds of the present invention have an activity of less than  $50\mu\text{M}$  in the Jurkat CS-1 assay or less than  $500\mu\text{M}$  in the Jurkat EC assay. Compounds with activity in the  
25       Jurkat CS-1 assay preferably have  $\text{IC}_{50}$  values of less than  $1\mu\text{M}$ , more preferably less than  $0.5\mu\text{M}$ , most preferably less than or equal to  $0.08\mu\text{M}$ . Compounds with activity in the Jurkat EC assay preferably have  $\text{IC}_{50}$  values of less than  $10\mu\text{M}$ , more preferably less  
30       than  $5\mu\text{M}$ , most preferably less than or equal to  $0.8\mu\text{M}$ .

      In the Jurkat EC Assay,  $\text{IC}_{50}$  value ranges ( $\mu\text{M}$ ) are depicted by A, B, and C and in the Jurkat CS-1 Assay,  $\text{IC}_{50}$  value ranges are depicted by D, E, and F. These ranges are as follows:

35       Jurkat EC:     $5 \leq A < 10$ ,  $0.8 < B < 5$ , and  $C \leq 0.8$   
      Jurkat CS-1:  $0.5 \leq D < 1$ ,  $0.08 < E < 0.5$ , and  $F \leq 0.08$

The following chart illustrates the  $IC_{50}$  values for selected compounds of the present invention in the Jurkat EC Assay and the Jurkat CS-1 Assay. The ranges are as described above.

#### Activity of Camphoric Acids in Dextran Pleurisy Model

Certain compounds of the present invention were  
 20 tested in a Dextran® pleurisy model.

#### Rationale for Developing an $\alpha_4\beta_1$ Integrin Antagonist to Treat Inflammatory Diseases

VLA-4, a member of the  $\beta_1$  integrin family of  
 adhesion molecules, is thought to play a critical role  
 25 in several types of inflammatory disease processes by  
 promoting leukocyte adhesion to vascular cell adhesion  
 molecule (VCAM-1) and the CS-1 domain of fibronectin  
 in extracellular tissue matrix (Elices MJ, Osborn L,  
 Takada Y, Crouse C, Luhowskyj S, Hemler M, Lobb RR.

Lymphoid cells recognize an alternatively-spliced segment of fibronectin via the integrin  $\alpha_4\beta_1$ . Cell; 60: 53-61, 1990) Of the cell

Attenuation of colitis in the cotton-top Tamarin by anti- $\alpha_4$  integrin monoclonal antibody. J Clin Invest; 92: 372-380, 1993). Since eosinophils represent a major component of the inflammatory cell influx in asthmatic lung tissue we developed a simple acute inflammatory model of VLA-4 integrin-dependent eosinophil infiltration which could be used to identify VLA-4 antagonists; such compounds would be of

potential value in the treatment of asthma as well as other diseases in which VLA-4 played a role.

#### Materials and Methods

##### Animals, housing and viral testing:

- 5 C57BL/6 mice (Jackson, Bar Harbor, ME; ), 6-8 weeks old, weighing 20-25g were used throughout. All mice were acclimated for at least 7-14 days after arrival and maintained under controlled temperature (20-22°C) and a 12 hr daily light cycle (6.00 A.M. - 6.00 P.M.).
- 10 Mice were housed in laminar flow racks and checked biweekly for viral infections (mouse hepatitis virus, minute virus of mice, rodent orphan parvovirus, Sendai) with kits obtained from Oreganon Teknika (Durham, NC) using established enzyme-linked
- 15 immunoabsorbent assays. Mice testing positive for any of the above were omitted from the study. All mice were fed standard laboratory chow (Upjohn Lab Rodent Irradiated Mouse Chow, #5011-3, PMI Feeds, St. Louis, MO) and acidified drinking water (pH 5.0) ad libitum.

##### 20 Induction of Inflammation by Intrapleural Injection of Dextran:

Intrapleural injections were made using a 27G needle cut to 3-4 mm and blunted by filing.

- 25 Injections were made by inserting the needle between the mid-intercostal ribs on the right side of the thoracic cavity.

- 30 Dextran (MW 5-40x10<sup>6</sup>, St Louis, MO.) was injected as a 10% solution in saline in a volume of 100µl/mouse. Care was taken to avoid bleeding at the site of injection at which the intercostal muscles were cut to facilitate smooth insertion of the needle.

##### Quantitation of Pleural Inflammatory Leukocyte Responses:

- 35 Pleural leukocytes were collected as follows: 4h post-induction, pleural inflammatory exudate was removed by washing with 2 x 1.0 ml Ca<sup>++</sup>/Mg<sup>++</sup> free HBSS

(Gibco, Grand Island, NY) containing 45 mg EDTA/100 ml HBSS, 4°C. Total leukocyte counts were made by hemocytometer following erythrocyte lysis in 2% acetic acid in PBS buffer; exudate leukocyte pellets were resuspended in serum for cytopspin preparations and stained (Diff Quik, Baxter Healthcare, McGraw Park, IL) for differential leukocyte counts (neutrophils, eosinophils, and mononuclear leukocytes). The pleural cavities of mice receiving either no intrapleural injection, or saline were washed and the cells counted in the same way to estimate baseline or saline-induced pleural leukocyte counts respectively.

#### Administration of drugs:

All drugs were dissolved in PBS and the pH adjusted to 7.5 with NaOH. Each drug was administered intravenously through the retroorbital sinus at hourly intervals (0-3h) starting from time "0" as indicated. Mice were carefully monitored for side effects; none were noted for the series of compounds reported herein.

The following camphoric acid analogues were tested for their inhibitory effects on dextran-induced leukocyte infiltration: Examples 4, 12, 54, 63, 166, 93, 180, 181, 183, 184, 217, Camphoric acid or PBS (saline) was administered iv. as a control. Inhibition of eosinophil infiltration, which was suppressed by anti-alpha-4 Mab (PS/2, 50%), was used as a readout of VLA-4 antagonist activity of the camphoric acids tested. Data for neutrophils are also reported.

#### Results:

Dextran pleural leukocyte response. The total pleural leukocyte counts were  $255 \times 10^4$  ( $\pm 16$  SEM) cells in the normal pleural cavity; of the normal pleural leukocyte population, all cells were mononuclear (a similar response was observed following intrapleural saline injection). Four hours after intrapleural injection

326

of dextran total pleural leukocyte counts increased to  $719 \times 10^4$  ( $\pm 67$  SEM) and comprised  $36.8 \times 10^4$  ( $\pm 4.1$  SEM) eosinophils,  $292 \times 10^4$  ( $\pm 25$  SEM) neutrophils and  $391 \times 10^4$  ( $\pm 48$  SEM) mononuclear leukocytes.

- 5 Inhibition of neutrophils and eosinophil (% $\Delta$ ) are depicted by A, B and C according to the following ranges:  $A \leq -50$ ,  $-50 < B \leq -10$ ,  $-10 < C \leq 0$

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 98/13064

### Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 16 and 17  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claims 16 and 17  
are directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims: it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
